Title: Maths Formula

Aim:

To write a Python program that evaluates a mathematical formula for the given input values and displays the result.

Algorithm:

1. Start.
2. Import the required library (`import math`, or `import numpy as np` if needed).
3. Read the input values (or assign them directly).
4. Apply the formula to the input values.
5. Store the result in a variable.
6. Display the result.
7. Stop.

Program:
