# Title: Matplotlib

## Aim:

To create and display different types of plots (line, bar, pie, scatter, histogram, etc.) using the Matplotlib library, with a title, axis labels and a legend where needed.

## Algorithm:

1. Start.
2. Import the Matplotlib library (`import matplotlib.pyplot as plt`) and NumPy (`import numpy as np`) if required.
3. Create or load the data to be plotted.
4. Select the type of plot and draw it using the matching function: `plt.plot()`, `plt.bar()`, `plt.barh()`, `plt.pie()`, `plt.scatter()`, `plt.hist()` or `plt.boxplot()`.
5. Customize the plot by adding a title, axis labels, legend, grid, colours and markers.
6. Save the figure using `plt.savefig()` if required.
7. Display the plot using `plt.show()`.
8. Stop.

## Program:
